

Elizabeth Goodwin  
Project 4

Data QC:

This part wasn't too difficult for me. I started to have some issues during the sections where I had to use `replace()`. I ended up just using `str.replace()` twice in a row and it worked. The lambda section was a bit hard to figure out, but consulting our worksheets helped and it ended up being fine.

`make_subset`:

This part of the project wasn't all that difficult. The main issue I had was I thought it worked perfectly, but I ended up using it incorrectly since all the examples allowed for multiple inputs in list form. I eventually figured this out and it ended up working fine.

`make_plot`:

This part was pretty easy. The syntax for creating plots were pretty simple and I consulted the readings for how to do it exactly. the hardest part was rotating the text to look correctly, and I had to consult the documentation for seaborn to figure out how to do that. Also having to switch over to a notebook to see the outputs easily was a chore. Overall was good.

Part three:

This part was more difficult. By far the biggest issue was working with series, as I am more used to dataframes. I had to redo most of the readings on series, which took a long time. Overall ended up working well. No big issues.
